Diameter ϕ50mm Shaft type Absolute Multi-turn Rotary encoders

NEW

▣Features

- ●Compact size of diameter ϕ50mm
- ●Parallel data / SSI data transmission type
- ●**Total 23bit resolution(8388608 divisions) of 10bit single-turn(1024 divisions) and 13bit multi-turn (8192 divisions)**
- ●Easy zero adjustment using single-turn / multi-turn data separated reset function
- ●Memorizing revolution data up to ±90° after blackout without memory back up function
- ●Possible CW/CCW direction setting with direction function
- ●Maximizing users convenience with lclear, overflow alarm (OVF) function
- ●Protection structure IP64(Partial waterproof, Oil proof)
- ●Provides Latch fuction(Parallel output model only)

▣Applications

Precision machine tool, Fabric machinery, Robot, Parking system

※**(★1)**It calibrates the multi-turn counts by comparing single-turn data before/after power off without counting multi-turn counts when power is off. It shall be used on the condition that no over-rated revolution occurred since proper multi-turn data may not be available if any revolutions occurred over ±90° from the position when power is off.
※**(★2)**OVF alarm is ON when multi-turn count is out of counting range (0 to 8191 revolution). It shall be initialized by changing the setting of direction or applying multi-turn count reset or clear signals.
※**(★3)**Single-turn data shall be initialized as 「0」 when single-turn data reset is input.
※**(★4)**Multi-turn count shall be initialized as 「0 revolution」 when multi-turn count reset is input.
※**(★5)**High active is customizable.

※Please wire properly.
※As for parallel output, it is recommended to connect +V and GND of both multi−turn count cable and single−turn data cable.
※The metal case and shield wire of encoder should be grounded (F.G).
※Input/Output cable must not be short−circuited, because Driver IC is used in output circuit.

▣Functions

◎Single-turn data reset

Single-turn data will be initialized as 「0」 when GND (low level) is input over 100ms on single-turn data reset line. In case of not using single-turn data reset line, connect the line to OPEN or +V (High level).

◎Multi-turn count reset

Multi-turn data will be initialized as 「revolution 0」 when GND(Low level) is input over 100ms on multi-count reset line. In case of not using multi-turn count reset line, connect the line to OPEN or + V (High level). OVF alarm will be initialized with muli-turn count reset input.

◎Clear

Single-turn data will be initialized as 「0」 and multi-count will be also initialized as 「revolution 0」 when GND (Low level) is input over 100ms on Clear line. In case of not using clear line, connect the line to OPEN or + V (High level). OVF alarm will be initialized with clear input.

◎Direction

Connect Direction line to OPEN or +V (High level) and turn on the power. Output will increase when rotation direction is CW from shaft axis. In case of connecting to GND(Low level), output will increase when rotation direction is CCW. If direction setting is reset, single-turn data, multi-turn count and OVF will be reset together since direction setting is initial setting which is set with Power ON.

◎Latch(Parallel output model only)

When connecting latch line to GND(Low level) over 500μs, outputs for single-turn data, multi-turn count and OVF at latch point will be remained. When latch line is connected to OPEN or +V (High level), output will be returned to operating mode output.

◎OVF

It is an alarm function providing output when multi-turn count is out of rotation ranges(0 to 8191 revolutions). OVF will be initialized through direction setting change, multi-turn count reset or clear input.
